

ABSTRACT OF THE DISCLOSURE

In the bill handling apparatus 100, there are provided the bill validating unit 10 which judges whether the bill received from outside is valid or not, the stacker 1 which is detachable with the main unit 2 and receives the bill judged as valid by the bill validating unit 10, the bill feed unit 30 which feeds the bill from the bill validating unit 10 in the length direction of the bill and the bill guide part 4 which temporarily holds the bill discharged from the bill feed unit 30. When the force P is exerted to the press force receiving plate 43, the push-in late 40 is contacted to the bill by the parallel crank mechanism 4P, thereby the bill is moved toward the bill support plate 50, thereafter the bill is stacked in the bill piling part 5 between the partition walls 4A, 4B and the bill support plate 50.
